Kirchhofer D; Hass PE, Judice JK, Devaux B, Eaton DL, Adams CW, Suggett S;

WPI; 2000-256595/22.

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction.

Claim 2; Fig 2; 84pp; English.

This sequence represents a complementarity determining region 1 (CDR1) of the heavy chain variable domain of a human anti-factor IX/Ixa Gla domain antibody. Pactor IXA/Ixa da vitamin K dependent plasma serine procease that participates in the blood coagulation pathways. The Gla domain of factor IXa and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial

```
Aspergillus oryzae KBN616 and Aspergillus sojae BA-104 respectively which have molecular weights of approximately 73 kD (as determined by gel filtration). The enzymes have an optimum temperature of approximately 50 degrees Celsius, and an optimum pH of about 8.5. The glutaminases catalyse the conversion of L-glutamine to L-glutamic acid, and may be used in the production of fermented foodsruffs such as soy sauce and miso. Sequences AABA1787-1814789 represent fragments of Aspergillus oryzae KBN616 glutaminase which were used as the basis for the design of degenerate PCR primers AAA72206, AAA72207 and AAA72209. These primers were used in the isolation of genomic DNA encoding Aspergillus oryzae
                                                                                                                                                                                                                                                                 ö
           the treatment or prophylaxis of thrombotic or coagulopathic diseases or disorders in a mammal for which inhibiting a FIX/IXa mediated event is indicated, e.g. deep venous thrombosis, arterial thrombosis, unstable angina, post myocardial infartronhosis, post surgical thrombosis, coronary artery bypass graft (CABG), percutaneous transluminal coronary angioplasty (PTCA), stroke, tumour growth, invasion or metastasis, inflammation, septic shock, hypotension, adult respiratory distress syndrome (ARDS), arterial fibrillation and disseminated intravascular coagulopathy (DIC)
platelets. Compositions comprising the antibodies are used for

The enzymes have an optimum temperature of approximately 50 degrees Celsius, and an optimum pH of about 8.5. The glutaminases catalyse the conversion of Leglutamine to Leglutamic acid, and may be used in the production of fermented foodstuffs such as 80y sauce and miso. Sequences AAB14784 bal4786 represent the N-terminal sequences determined for three V8 protease fragments (P1-P3) of Aspergillus oryzae KEN616 glutaminase in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The invention relates to a human monoclonal antibody or its antigen binding fragments, which exhibit immunological binding affinity for a hepatitis C virus (HCV) B1 antigen, comprising an amino acid sequence homologous to the binding portion of a human antibody Fab molecule from a combinatorial antibody library. The vaccine composition comprising the antibodies or antigen binding fragments against HCV B1 or B2 antigen or its hypervariable region is useful in treating or preventing HCV infection in a subject. Sequences ABC76513-ABG76568 represent human monoclonal antibodies against HCV B1 antigen
comprising a human monoclonal antibody against hepatitis C virus or E2 antigen, useful for treating or preventing HCV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to producing gene libraries, comprising immunoglobulin light and heavy variable region. The method involves selecting light chain that binds with the heavy chain product to produce a functional conformation, producing a gene library comprising a collection of these light chain variable genes, and combining with gene library of heavy chain variable genes. The method is used for production of gene and antibody libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; HCV; hepatitis C virus; El antigen; monoclonal antibody; vaccine; hepatotropic; Fab; hypervariable region; E2 antigen; antibody.
                                                                                                                                                                                                                                                                                                                                                              Producing gene libraries and antibody libraries, involves selecting a

The invention relates to an isolated nucleic acid comprising any one of
the 6213 antisense sequences given in the specification where expression
of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a pronoter operably linked to the nucleic acid
cenceding a polypeptide whose expression is inhibited by the antisense
nucleic acid; (2) a host cell containing the vector; (3) an isolated
cantisense nucleic acid; (4) an antibody capable of specifically binding
cantisense nucleic acid; (4) an antibody capable of specifically binding
the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
contiferation or the activity of a gene in an operon required for
proliferation; (7) identifying a compound that influences the activity of
the gene product or that has an activity against a biological pathway
cc proliferation, or that inhibite cellular proliferation of the gene product or that has an activity against a biological pathway
cc required for proliferation-required gene or its gene product lies
cc pathway in which he test compound that inhibits proliferation of an
compound's activity; (11) a culture comprising strains in which the gene
cc product is overexpressed or underexpressed; (10) profiling a
compound's activity; (11) a culture comprising strains in which the gene
cc product is overexpressed or underexpressed; (12) determining the extent
cc owhich each of the strains is present in a culture or collection of
ct to which each of the strains is present in a culture or collection of
ct proliferation of an organism. The antisense nucleic acids required
cf for cellular proliferation to isolate candidate molecules for rational
cf for cellular proliferation for for screening homologous nucleic acids
crips are acids
crips and discovery programs, or for screening homologous nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                             Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zyskind JW;

The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and polymucleotides encoding them. The sequences are useful in diagnosis and polymucleotides encoding them. The sequences are useful in diagnosis and prophylaxis and treatment of pathological conditions resulting from a prophylaxis and treatment of pathological conditions resulting from a compound, such as a polymeptide, or fetctive antibacterial targets, as targets for antibacterial durgs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa drugs, as templates for recombinant components for diagnosis and/or treatment of P. aeruginosa caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826-ABO84396 represent P. aeruginosa polypeptides of the invention. Note: The sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed production of production 
                                                                                                                                                                                                                                                                                           ö
required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment o pathological conditions resulting from bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bacterial infection; Pseudomonas aeruginosa infection; antibacterial.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to prowide for expression of a polymuclectide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant that may no method of producing a plant with the recombinant DNA construct and growing the transforming a plant with the polymiclectide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, better growth rate by modification of homologous recombination, modification of carbohydrate, nitrogen or content, improved yield by modification of photosynthesis or by phosphorus use and/or uptake, by modification of photosynthesis or by providing improved lignin production or improved galactomannan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant DNA construct comprising a promoter positioned to provide for expression of a polymucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                    Recombinant DNA construct; transformed plant; improved plant property; cold tolerance; heat tolerance; drought tolerance; berbicide; osmosis; pathogen tolerance; pest tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.

The present sequence is a polypeptide encoded by one of 344 newly mined human genes. It was used as a query sequence in a database search of olfactory receptor (OR) like sequences. The invention relates to isolated polymucleotides encoding polypeptides involved in olfactory sensation. The polymucleotides can be used in screening for olfactory agonists and artagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining differences in the olfactory faculties of different
                                                                                                                                                                           ö
production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at segdata.uspto.gov/sequence.html.
                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, olfactory receptor; OR; primary scent determination;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is an olfactory receptor which is encoded by one of a number of novel polynucleotides. The polynucleotides can be used in screening for olfactory agonists and antagonists. The methods allow for the determination of primary scents and the identification of the odour receptors used to detect these primary scents. The methods also enable determination of secondary scents and the identification of combinations of odour receptors that are involved in detecting such secondary scents. This enables the construction of a scent representation (also called a scent fingerprint or scent profile), which may be used to re-create and edit scents. Libraries of olfactory receptors are useful for determining the interaction pattern of a composition with the receptors, and can be used for determining the determining differences in the olfactory faculties of different

This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to molecules and the encoded proteins thereof. Specifically, it refers to conda clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodies, antisense molecules and siRNAs that can all be used to bind to antibodies, antisense molecules and siRNAs that can all be used to bind to antibodies are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating ostcoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia, short memory and various cancers, disease, parkinson's disease, dementia, short memory and various cancers, for treating emotional reaction, fear response and panic. Accordingly, they exhibit ostcopathic, neuroprotective, nootropic, antiparkinsonian, cycostatic and tranquiliser activities. This sequence is not given in the sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but can be obtained on CD-ROM from the European Patent Office, Vienna Sub-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Aspergillus oryzae-originated glutaminase and partial amino-acid sequences for enhancing taste particularly in glutamic acid-converting food processing to make e.g. seasoning sauces and pastes. WPI; 2000-053292/04. N-PSDB; AAZ43684.

Example 3; Page 52-55; 74pp; Japanese.

This invention describes a novel glutaminase enzyme isolated from Aspergillus oryzae which catalyses the decomposition of glutamine to glutamic acid and ammonia. The purified glutaminase and determined partial amino-acid sequence can be used for enhancing taste particularly in glutamic acid-converting food processing to give e.g. seasoning sauces and partes as well as other seasoning materials. The gene thus obtained DNA fragments from genome and collation providing the gene-containing novel strain of an subsequently modified glutaminase-producing breed. The nidulans, and subsequently modified glutaminase-producing breed. The secreting ability. This sequence represents the A. oryzae and encerting ability. This sequence represents the A. oryzae glutaminase enzyme described in the method of the invention

Aspergillus oryzae-originated glutaminase and partial amino-acid sequences for enhancing taste particularly in glutamic acid-converting food processing to make e.g. seasoning sauces and pastes.

Claim la; Page 41-44; 74pp; Japanese.

This invention describes a novel glutaminase enzyme isolated from Aspergillus oryzae which catalyses the decomposition of glutamine to glutamic acid and ammonia. The purified glutaminese and determined partial amino-acid sequence can be used for enhancing taste particularly in glutamic acid-converting food processing to give e.g. seasoning sauces and pastes as well as other seasoning materials. The gene thus obtained can be applied as probe for hybridization providing the gene-containing DNA fragments from genome and cDNA libraries of A. oryzae and A. nidulans, and subsequently modified glutaminase-producing breed. The novel strain of A. oryzae is a highly active because of its somatic secreting ability. This sequence represents the A. oryzae glutaminase enzyme described in the method of the invention

Aspergillus oryzae

```
This sequence represents a novel glutaminase from Aspergillus oryzae KBN616. The invention relates to two novel glutaminases (AAB14781, AAB14782) from Aspergillus oryzae KBN616 and Aspergillus sojae BA-104 respectively which have molecular weights of approximately 73 kD (as determined by gel filtration). The enzymes have an optimum temperature of approximately 50 degrees Celsius, and an optimum ph of about 8.5. The glutaminases catalyse the conversion of L-glutamine to L-glutamic acid, and may be used in the production of fermented foodstuffs such as soy

Sequence 26, Application US/08918148A

Patent No. 6342220

GENERAL INFORMATION:
APPLICANT: Adams, Camellia
APPLICANT: Garter, Paul J.
APPLICANT: Garter, Paul J.
APPLICANT: Gurney, Austin L.
TITLE OF INVENTION: Agonist Antibodies
FILE REFERENCE: 10979
CURRENT APPLICATION NUMBER: US/08/918,148A
CURRENT FILING DATE: 1997-08-25
NUMBER OF SEQ ID NOS: 79
SEQ ID NO 26
LENGTH: S
TYPE: PRT
OGGANISM: artificial
FEATURE:
NAME/KEY: 10D108cFv, 12B5scFv VH CDR1
COCATION: 1-5
COCHION: 1-5
COCHION

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Oylochrome P450 3A6 (version 1) - rabbit
NyAlternate names: cytochrome P450 3c
NyContains: oxidoreductase (EC 1.-.-.)
NyContains: oxidoreductase (EC 1.-.-.)
NyContains: oxidoreductase (EC 1.-.-.)
NyCocession: A29487
C;Date: 31-Dec-1988 #sequence_revision 31-Dec-1988 #text_change 09-Jul-2004
C;Date: 31-Dec-1988 #sequence of cytochrome P450 3c cDNA and presence of two mRNA species NA;Reference number: A29487
A;Reference number: A29487
A;Reference number: A29487
A;Residues: 1-501 cDNA
A;Residues: 1-501 cD

RESULT 14

```
Cytochrome P450 3A6 (version 2) - rabbit

NyAlternate names: cytochrome P450 3c

NyContains: oxidoreductase (EC.1.....)

Species oxidoreductase (EC.1.....)

Cypecies 31-Mar-1992 #sequence_revision 31-Mar-1992 #text_change 09-Jul-2004

CyAccession: A34236

Complete sequence and gene organization of the genome of a hyper-
thermophilic archaebacterium, Pyrococcus horikoshii OT3.";
DNA Res 5:55-76(1988).

--- CATALYIC ACTIVITY: ATP + AMP = 2 ADP.
--- CATALYIC ACTIVITY: ATP + AMP = 2 ADP.
--- SUBCELLUJAR LOCATION: Cytoplasmic (By similarity).
--- SIMILARITY: Belongs to the archaeal adenylate kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Archaea; Euryarchaeota; Thermococci; Thermococcales; Thermococcaceae;

"PI; 2000-256595/22.

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction.

Claim 2; Fig 2; 84pp; English.

This sequence represents a complementarity determining region 2 (CDR2) of the heavy chain variable domain of a human anti-factor IX/IXa Gla domain antibody. Factor IXA a vitamin K dependent plasma serime procease that participates in the blood coapulation pathways. The Gla domain of factor IXa and its zymogen factor. IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial

```
Novel human antibody which binds human interleukin (IL)-4 receptor and is capable of inhibiting IL-4 induced biological activity, functions as IL-4 antagonist and is useful for treating septic arthritis, scleroderma.
                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a human antibody (an interleukin (IL)-4 antagonist) (I) that binds human IL-4 receptor (IL-4R), and is capable of
the treatment or prophylaxis of thrombotic or coagulopathic diseases or disorders in a mammal for which inhibiting a FIX/IXa mediated event is disorders in a mammal for which inhibiting a FIX/IXa mediated event is indicated, e.g. deep venous thrombosis, atterial thrombosis, unstable angina, post myocardial infarction, post surgical thrombosis, coronary artery bypass graft (CABG), percutaneous transluminal coronary angioplasty (PTCA), stroke, tumour growth, invasion or metastasis, inflammation, septic shock, hypotension, adult respiratory distress syndrome (ARDS), arterial fibrillation and disseminated intravascular coagulopathy (DIC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; antibody; interleukin; IL-4; antagonist; receptor; IL-4 receptor;

```
inhibiting an IL-4-induced biological activity. (I) is also useful for inhibiting both IL-4-induced biological activity and IL-13-induced in a human, and for treating septic arthritis in a human afflicted with septic arthritis. (I) is also used for treating conditions such as septic/reactive arthritis, dermatitis herpetiformis, conditions such as septic/reactive arthritis, dermatitis herpetiformis, urticata (septical) ulcers, gastric inflammation, mucosal inflammation, ulcerative colitis, Crohn's disease, inflammation, bowel disease, other disorders of the digestive system in which IL-4 plays a role (e.g. IL-4-induced inflammation of part of the gastrointestinal tract), conditions in which IL-4-induced barrier disorders of the digestive system in the graphical partier function in the lung or gastrointestinal tract), scleroderma, hypertrophic scarring, Whipple's disease, benign prostate complete and proper sickle cell disease, benign prostate traction, kawasaki disease, sickle cell disease or crisis. Churge. Strauss syndrome, drave's disease, pre-eclampsia, sjogen's syndrome, caucoimmune lymphoproliferative syndrome, autoimmune blastering complete also find use as adjuvante muscular disease), and myasthenia garvis (an autoimmune blistering consequence represents an autoimmune mascular disease). IL-4 and as a consequence represents an anti-IL-4 receptor monoclonal antibody which it response would be beneficial in treating or preventing the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

This invention describes novel antibodies that immunospecifically bind to be Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell to proliferation and differentiation. The antibodies of the invention have proliferation, immunosuppressive, immunostimulant, immunomodulatory, antithematic and antihals activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be associated to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumacoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and cautibodies and fragments of the antibodies described in the method of the invention
                                                           Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

Claim 1; Page 1495-1496; 3148pp; English.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell control of the cumour necrosis factor (TNF) super family and induces B cell control of the invention and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antithemmatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant Expression of BLyS. They may also be associated with aberrant axpression of BLyS. They may also be and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and iseases e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiancy (e.g. common variable immunodeficiency (c.UID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13q34 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFvs) derived, preferably, from the variable composition to factor immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The composition, disquests and prognosis of diseases related to the ederection, diagnosis and prognosis of diseases related to the ederection, diagnosis and prognosis of diseases related to the caperrant expression or inappropriate function of BLyS or its receptor. As uch, these compositions are useful for identifying immune diseases concluding myserbania and rheumatoid arthritis, infectious diseases such disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as ALDS and proliferative disorders including leukaemia, carcinoma and corivities such as anticheumatic, antiallergic and cytostatic. This collypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of directely from WIPO at ftp.wipo.int/published pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.

Example 1; SEQ ID NO 1323; 394pp; English.

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 1343 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (GCFWs) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monky BLyS. The cypesent invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of such antibodies in various methods for the detection, diagnosis and prognosis of identifying immune disorders including myasthenia gravis and multiple sclerosis inflammatory compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis inflammatory disorders including leukemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiallergic and cytostatic. This continited sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the principle for the principle for the principle format and relevance of the principle. directely from WIPO at ftp.wipo.int/pub/published pct_sequences. 858888888888888888888888888888888

Antibodies against B Lymphocyte Stimulating polypeptides, useful for the

```
Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosais factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity and can be used in vaccines to inhibit the expression and activity of an antibodies bind to biological samples and may be used in this way to disgnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and
                                                                                                                                                                                                                                                                                              diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to novel antibodies that immunospecifically bind
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single chain antibody that immunospecifically binds BLyS SeqID 1114.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antibody; B lymphocyte stimulator; BLyS; tumour necrosis factor; B cell proliferation; differentiation; scFv; myasthenia gravis; multiple sclerosis; asthma; rheumatoid arthritis; AIDS; leukaemia; carcinoma; lymphoma; antirheumatic; antiarthritic; neuroprotective;

to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 13q34 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single cohain antibody molecules (scFvs) derived, preferably, from the variable cohain antibody molecules (scFvs) derived, preferably, from the variable composition to make the variable region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The contract special properties and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders such, these compositions are useful for identifying immune disorders uncluding mysathenia agravis and multiple sclerosis, inflammanory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as ALDS and proliferative disorders including leukaemia, carcinoma and conjunctions and antiathering in an exhibiting various cartivities such as antitheumatic, antiallergic and cytostatic. This collypeptide sequence is a single chain antibody that binds BLyS of the cinvention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format confired the printed specification, but was obtained in electronic format.

Nile virus

The present invention describes a human heterodimeric antibody (I) (fragment) having a binding affinity of at least lx10-8 M to the protective antigen of Bacillus anthracis or a molecule involved in anthrax infection that blocks binding of the antigen or molecule to cell receptors, edema factor and lethal factor. (I) has vincide and antibacterial activities, and can be used in immunotherapy. The antibodies (I) are useful as anti-toxins or anti-infectives with respect to infective agents, such as antehrax, botulinum, smallpox, Venezuelan equine encephalomyelitis virus (VEEV), or West Nile virus (WNV). The present sequence represents a human heterodimeric antibody heavy chain of the present invention. Claim 11; SEQ ID NO 97; 67pp; English.

Novel neuromodulatory agent (a human IgM monoclonal antibody), promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system, useful to treat post-infectious encephalomyelitis

Claim 23; Fig 17; 219pp; English.

The invention provides a neuromodulatory agent (1) capable of promoting neurite outgrowth, regeneration, remyelination and neuroprotection in central nervous system (CNS). (1) is capable of inducing remyelination, promoting cellular proliferation of glial cells, and promoting G22+ signaling with oligodendrocytes. An humanised antibody to (1) can be selected from antibody sHIGM22 (LYM 22), eVHIGM MSI19D10, ebv HIGM cB22bG8, AKGN4, CB21E12, CB21E7 or MSI19ES. (1) is useful for stimulating remyelination of CNS axons, stimulating proliferation of glial cells in 

CC CNS axons, or treating demyelinating disease of CNS in a mammal in need of such therapy. (I) is capable of binding to structures and cells within CC CNS. (I) is preferably useful for treating a demyelinating disease of CNS of a mouse infected with Strain DA of Theiler's murine encephalomyelitis of a mouse infected with Strain DA of Theiler's murine encephalomyelitis (TMEV) or for treating a human being having multiple sclerosis, or a post-order of muan or domestic animal with a viral demyelinating disease, or a post-order of muan or domestic animal with a viral demyelinating disease, or a post-order of stamulating the proliferation of gial cells from mixed cell culture. (I) is also useful for stimulating remyelination of CNS axons. The antibodies care useful for preventing infection by a bacterium, virus or like pathogen that causes demyelination or other neurodegenerative condition in a subject. Methods where (I) is administered to a patient are useful concerned multiple sclerosis, Parkinson's disease, Alzheimer's clisease, amyortophic lateral sclerosis (ALS), a viral demyelinating clisease, and other conditions in the CNS where nerves are damaged as by trauma. The present sequence represents the sHigM22 heavy axy axy and a constructions acid sequence.

Immunopolypeptide for diagnosis and treatment of human autoimmune disease, e.g., human rheumatoid arthritis, comprises a polypeptide that binds to human glucose-6-phosphate isomerase.

Claim 3; Fig 4A; 47pp; English.

The invention describes an immunopolypeptide comprising a polypeptide that binds to human glucose-6-phosphate isomerase (GPI). The methods a compositions are used for disgnosis and treatment of human autoimmune disease, e.g., human rheumstoid arthritis. This is the amino acid sequence of human anti-GPI-antibody heavy chain variable region

The invention provides a neuromodulatory agent (I) capable of promoting central nervous system (CNS). (I) is capable of inducing remyelination, central nervous system (CNS). (I) is capable of inducing remyelination, central nervous system (CNS). (I) is capable of inducing remyelination, central nervous system (CNS). (I) is capable of antibody to (I) can be signaling with oligodendrocytes. An humanised antibody to (I) can be capable of building melipoly, every High Melipoly. (I) can be considered antibody aliga22 (LMM 22), ebvHigh Melipoly. (I) can be selected from antibody shiga22 (LMM 22), ebvHigh Melipoly. (I) is useful for stimulating consideration of CNS axons, or treating demyelinating proliferation of glial cells in consideration of customers and cells in memman in need considerating the preferably useful for treating a demyelinating disease of CNS (CNS). (I) is preferably useful for treating a human being having multiple sclerosis, or a consume infected with Strain DA of Theiler's murine encephalomyelitis (TMEV) or for treating a human being having multiple sclerosis, or a post-neural disease of CNS. (I) is also useful for simulating remyelination of CNS axons. The antibodies are useful for stimulating remyelination of CNS axons. The antibodies consumed the proliferation of gial cells from mixed cell culture. (I) is also useful for stimulating remyelination or other neurodegenerative condition in a subject. Methods where (I) is administered to a patient are useful continued and other conditions in the CNS where nerves are consistent and other conditions in the CNS where nerves are conditions and the conditions in the CNS where nerves are conditions and the conditions in the CNS where nerves are conditions and the conditions in the CNS where nerves are conditions and the conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Sequence 16, Application US/09383667

Patent No. 6624295

GENERAL INFORMATION:
APPLICANT: Adams, Camelia W.
APPLICANT: Beroux, Brigitte
APPLICANT: Baton, Dan L.
APPLICANT: Hass, Philip E.
APPLICANT: Hass, Philip E.
APPLICANT: Kirchnfer, Daniel
APPLICANT: Kirchnfer, Daniel
APPLICANT: Kirchnfer, Daniel
APPLICANT: Suggett, Shelley
TITLE OF INVENITON: Human Anti-Factor IX/IXA Antibodies
TILE REFERENCE: 91661R2
CURRENT APPLICATION NUMBER: US/09/383,667

CURRENT FILING DATE: 1998-08-28

EARLIER APPLICATION NUMBER: US 60/122,767

EARLIER FILING DATE: 1999-03-03

NUMBER OF SEQ ID NOS: 32

Sequence 115, Application US/08545809A
Patent No. 6096878
GENERAL INFORMATION:
APPLICANT: Hendo, Tasuku
APPLICANT: Matauda, Fumihiko
TITLE OF INVENTION: HUMAN IMMUNOGLOBULIN VH GENE
TITLE OF INVENTION: SEGMENTS AND DNA FRAGMENTS CONTAINING THE SAME
NUMBER OF SEQUENCES: 145
CORRESPONDENCE ADDRESS:

INCOMEDIATION

Sequence 46, Application US/08331398A

Patent No. 5608039

GENERAL INFORMATION:

APPLICANT: Pastan, Ira

APPLICANT: PatrGerald, David

APPLICANT: Brinkmann, Ulrich

APPLICANT: Single Chain B3 Antibody Fusion Proteins

ITLE OF INVENTION: and Their Uses (as amended)

CORRESPONDENCES.

ADDRESSEE: Townsend and Townsend and Crew

STREET: One Market Plaza, Steuart Street Plaza

CITY: San Francisco

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Published Applications AA:*

Pattent with macroglobulinemia.

- I - MISCELLANEOUS: This mu chain was isolated from the plasma of a pattent with macroglobulinemia.

- I - SIMILARITY: Contains 1 immunoglobulin-like domain.

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction.

Claim 2; Fig 2; 84pp; English.

This sequence represents a complementarity determining region 3 (CDR3) of the heavy chain variable domain of a human anti-factor IX/Ixa Gla domain antibody. Factor IXA/Ixa da vitamin K dependent plasma serine procease that participates in the blood coagulation pathways. The Gla domain of factor IXa and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial

```
This sequence represents a complementarity determining region 3 (CDR3) of the heavy chain variable domain of a human anti-factor IX/IXa Gla domain antibody. Factor IXa is a vitamin K dependent plasma serine protease that participates in the blood coagulation pathways. The Gla domain of factor IXa and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial cells and platelets. Compositions comprising the antibodies are used for the treatment or prophylaxis of thrombotic or coagulopathic diseases or disorders in a mammal for which inhibiting a FIX/IXa mediated event is
the treatment or prophylaxis of thrombotic or coagulopathic diseases or disorders in a mammal for which inhibiting a FIX/IXa mediated event is indicated, e.g. deep venous thrombosis, arterial thrombosis, unstable angina, post myocardial infarction, post surgical thrombosis, coronary artery bypass graft (CABG), percutaneous transluminal coronary artery bypass graft (thrombosis), percutaneous transluminal coronary angloplasty (PTCA), stroke, tumour growth, invasion or metastasis, inflammation, septic shock, hypotension, adult respiratory distress syndrome (ARDS), arterial fibrillation and disseminated intravascular coagulopathy (DIC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Complementarity determining region 3; CDR3; antibody; Gla domain; factor IX/IXa; blood coagulation; deep venous thrombosis; arterial thrombosis; unstable angina; post myocardial infarction; coronary artery bypass graft; CABG; stroke; tumour growth; metastasis; percutaneous transluminal coronary angioplasty; PTCA; inflammation; septic shock; hypotension; adult respiratory distress syndrome; ARDS; arterial fibrillation; disseminated intravascular coagulopathy; DIC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Anti-factor IX/IXa antibody H chain V domain CDR3 amino acid sequence.

The invention relates to a recombinant DNA construct comprising a promoter functional in plants operably linked to an oil-associated gene. The construct is useful for transgenic plant seed which has in its genome the construct, that is functional in the plant to transcribe the oil associated gene. The transgenic plant seed grows into a plant having enhanced seed oil as compared to wild type. The construct is useful for producing hybrid maize seed. The transgenic plant seed is useful for producing vegetable oil. The present sequence represents the amino acid sequence of an oil-associated gene related protein.
                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to Oytokine. Call prollferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                             Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soppear. The method of producing a transformed plant cauch as maize or soppear. The method of producing a transformed plant cauch as maize or soppear. Occuping the transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plants with improved plant properties, e.g. improved cold, heat or drought tolerance, colerance to herbicides, extreme camping conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved yield by modification of carbohydare, introgen or providing improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress condition, improved plants production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form form or interprofucion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 14688; 122pp; English.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to promote a provide defect a polynoucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant the recombinant DNA construct and growing the transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties.

The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or producing plants with improved plant properties, e.g. improved cold, heat or progens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the grope of the invention. Note: The sequence data for this patent did not form at from USPTO at segdata.uspto.gov/sequence.html.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypoptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant bank construct and a method of producing a cransformed plant having an improved property. The plant is a crop plant cut as maize or soppears. The method of producing a transformed plant construct and growing the transformed plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant with the colympost or polypeptide is useful for improving plants with improved plant properties, e.g. improved cold, heat or a drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or peets, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth rappose increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 11635; 122pp; English.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant with the having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with

improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.

Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and related polypeptides.

Claim 6; SEQ ID NO 1265; 192pp; French.

of L The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments it are useful for selecting probes and primers for detecting genes in monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins

```
expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially blosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fitp.wipo.int/pub/published_pct_sequences
                      8$8888888888888

AAY36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogramulomatosis. The polypeptides of the invention may be of use in treating these diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine, eye disease; conventional trachoma; nonendemic trachoma; paratrachoma; inclusion conjunctivitis; genital disease; perihepatitis; nongonococcal uretritis; epidymitis; cervicitis; salpingitis; bartholinitis; pneumopathy; venereal lymphogranulomatosis.

```
The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant with the ecombinant DNA construct and growing the transformed plant with the correction or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with inproved plant properties, e.g. improved cold, heat or a facught tolerance, collarance to herbicides, extreme osmotic conditions, pathogens or peats, increased resistance to plant disease, better growth rate by modification of the content, improved yield by modification of carbohydrate, introgen or phosphorus use and/or uptake, by modification of forbotosynthesis or by production, improved light, production or improved galactomannan condition, improved light, by modification or improved galactomannan condition, improved light production or improved galactomannan compant of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic correct of the printed specification but was obtained in electronic correct of the printed specification but was obtained in electronic correct of the printed specification but was obtained in electronic correct of the printed specification but was obtained in electronic correct of the printed specification but was obtained in electronic correct of the printed specification but was obtained in electronic corrections.
